

partAdvisor

Caner Ayrancı

part Advisor

Araç sahiplerine araçları ve kullanım alışkanlıklarına uygun şekilde lastik ve ilerde dahasını tavsiye etmek amacıyla başlanmış bir projedir.

Projenin kesinlikle bir ürün satış çabası olmamakla beraber tamamen kullanıcıların kendilerine en uygun marka ve modelleri önceden keşfetmesini hedeflemektedir.

partAdvisor nedir?

-
- Desteklenen markalardaki desteklenen modeller arasında kullanıcının araç marka ve modeline en uygun, tahmini genel yükü ele alınarak, en ekonomik, günlük kullanım ya da performansa dayalı lastik tavsiyesi yapabilmektedir.
-

December 25, 2023 - 00:20:09
Django version 5.0, using settings 'backend.settings'
Starting development server at http://127.0.0.1:8000/
Quit the server with CTRL-BREAK.
```

Backend tamamen Python dili ve Django framework'ü üzerinde yazılmıştır. Virtual Environment (venv) yapısı ile local içerisindeki diğer projeler ile gereklilik çakışmaları önlenmektedir

Veriler Django üzerinde oluşturulan modeller ile
framework'ün oluşturacağı sqlite3 veritabanında tutuluyor

```
from django.db import models
```

```
class Tire(models.Model):
```

```
    id = models.IntegerField(primary_key=True)
    model_id = models.IntegerField()
    brand = models.CharField(max_length = 200)
    model = models.CharField(max_length = 400)
    tireSpecs = models.CharField(max_length= 10)
    mevsim = models.CharField(max_length= 100)
    fuelNote = models.CharField(max_length= 1)
    performance = models.CharField(max_length= 25)
    price = models.IntegerField()
```

```
    def __str__(self):
        return self.brand + ' ' + self.model
```

```
class Vehicle(models.Model):
```

```
    model_id = models.IntegerField(primary_key=True)
    user_id = models.IntegerField()
    brand = models.CharField(max_length= 200)
    model = models.CharField(max_length= 400)
    fuelType = models.CharField(max_length= 100)
    tireSpecs = models.CharField(max_length=10)
    tireWidth = models.IntegerField()
    tireHeight = models.IntegerField()
    rimSize = models.IntegerField()
```

```
    def __str__(self):
        return self.brand + ' ' + self.model
```

```
class User(models.Model):
```

```
    user_id = models.IntegerField(primary_key=True)
    username = models.CharField(max_length= 20)
    email = models.CharField(max_length= 100)
    password = models.CharField(max_length= 20)
    model_id = models.IntegerField(null = True, blank = True)
```

URLS

Help

Reason given for failure:

Origin checking failed - `https://3788-5-176-232-225.ngrok-free.app` does not match any trusted origins.

In general, this can occur when there is a genuine Cross Site Request Forgery, or when [Django's CSRF mechanism](#) has not been used correctly. For POST forms, you need to ensure:

- Your browser is accepting cookies.
- The view function passes a request to the template's [render](#) method.
- In the template, there is a `{% csrf_token %}` template tag inside each POST form that targets an internal URL.
- If you are not using `CsrfViewMiddleware`, then you must use `csrf_protect` on any views that use the `csrf_token` template tag, as well as those that accept the POST data.
- The form has a valid CSRF token. After logging in in another browser tab or hitting the back button after a login, you may need to reload the page with the form, because the token is rotated after a login.

You're seeing the help section of this page because you have `DEBUG = True` in your Django settings file. Change that to `False`, and only the initial error message will be displayed.

You can customize this page using the `CSRF_FAILURE_VIEW` setting.
